

Cohort grading – 10 agents

Comparable-to-canonical: 9/10  
Non-canonical / flagged: 1/10

Improvement on primary metric (self-reported, % – higher is better):

- cohort median: +29.3%
- cohort range: +7.8% ... +44.7%
- median among canonical only: +30.2%

Pages:

- 1 – Outcome bars (this view): per-agent % improvement, with non-canonical agents fl
- 2 – Attribution: what each agent credits for the gain (stacked by their own variant
- 3 – Rubric heatmap: methodology pass / fail / null per agent × rubric item

Caveats:

- Improvement percentages are self-reported on the agent's chosen metric & unit. Different agents picked rad/s, mrad/s, deg/s, and °/s on different masks and splits. The % is the only universally-comparable axis; absolute values are not.
- A non-canonical bar (grey + hatched) means the agent scored on a non-canonical platform OR substituted a fabricated proxy for the measured truth channel. Its number is not directly comparable to the canonical bars.

Outcome — how much each agent improved the lateral metric  
(grey + hatched = non-canonical platform / fabricated proxy)

Attribution breakdown — what each agent credits for the improvement

Methodology rubric — green ✓ pass, red ✗ fail, grey — null/not addressed
