- Page 3 — Attribution: what each agent credits for the improvement
- Page 4 — Methodology rubric heatmap (agents × rubric items)

Caveats

Improvement % is self-reported on the agent's chosen metric and unit.
Different agents picked rad/s, mrad/s, deg/s, °/s on different masks and splits.
Relative % is the only universally comparable axis; absolute values are not.

A non-canonical bar (grey) means the agent scored on a non-canonical platform
OR substituted a fabricated proxy for the measured truth channel. Its number
is not directly comparable to canonical bars.

Outcome — improvement on the lateral metric (alphabetical)

Top contributor per agent is shown on page 3 (attribution breakdown).

Attribution breakdown — variant contributions per agent (alphabetical)

Methodology rubric — green ✓ pass · red ✗ fail · grey — null / not addressed
